1. Use the training data in the previous assignment those are from the 1000000 sentences in your language. Do the following tasks.
    a. Train the word2vec model on the training data.
    b. Train the fastText model on the training data.
    c. Train the Doc2Vec model on the training data.
2. Use K-means clustering to cluster the words in the training data.
    a. Represent each cluster with 20 words closest to each cluster centroid.
    b. Represent each sentence in the validation and test set as a vector using word embeddings and Doc2Vec embeddings. For each sentence in these sets, find the closest sentence.
